

The Night Sky

July

Equipment you will need

Because of the darkness of our forest locations, you can see many wonders of the night skies with your naked eye, although your eyes will need a good 20 minutes to adjust to the darkness. Any bright lights, such as that from your torch, will set them back again. You can reduce this effect by putting a red filter on your torch. Equipment worth investing in includes:

- **Binoculars** – cheaper and easier to carry than a telescope. Look for ones with glass lenses.
- **Camera** – to capture that fantastic star scene forever
- **Tripod** – essential for use with your camera
- **Telescope** – worth investing in for the really committed stargazer
- **Google Skymaps** – a superb free app, available for Android and iPhone. You point your phone towards the sky and it shows you the constellations and identifies the stars using inbuilt GPS

Getting started – your first 5 constellations to spot

- **Ursa Major** (the Big Dipper) has been used by sailors since ancient times to locate the fixed-point Pole Star and navigate home
- **Leo** (the lion) is it a lion, as the Greeks decided? Or is it K9 from Doctor Who?
- **Cassiopeia** (the queen of Aethiopia) is one of the easiest constellations to locate and looks like a huge W, almost directly overhead
- **Cepheus** (the king of Aethiopia) is one of 48 constellations identified by 2nd century astronomer Ptolemy. Imagine a child's drawing of a house, complete with roof
- **Orion** (the hunter), with belt and sword, is perhaps the most famous constellation – and one of the few that actually bears some slight resemblance to its namesake

Stargazing facts for kids

- You can see the International Space Station without using binoculars, and you can track it moving across the sky
- The sun is 300,000 times bigger than earth and 93 million miles away. If you could catch a plane to the sun, the journey would take 20 years
- We're more connected than you might think. The gravity of the sun and moon bring about the tides in our seas
- Footprints and tyre marks on the moon from the Apollo 11 mission will stay there forever – there is no wind to blow them away
- How much do you weigh? If you weigh 50kg here on earth you would only weigh 19kg on Mars because of lower gravity

Corona Australis

Meaning 'southern crown', this is the southern counterpart of Corona Borealis, the northern crown. Some cultures have likened this constellations pattern to a turtle, ostrich nest or a tent.

Scutum

Introduced in the 17th century this constellations name means shield. The space probe 'Pioneer 11' is moving in the direction of this constellation, though it won't reach it for many thousands of years, by which time its batteries will be long dead!

Sagittarius

Lying between Ophiucus and Capricornus, Sagittarius is one of the signs of the zodiac and is commonly represented as a centaur drawing a bow.

Ursa Major

Known as the 'Great Bear' and listed as one of our first five constellations to spot, Ursa Major has mythological significance in numerous world cultures.

Cassiopeia

It's recognisable 'W' shape is formed by five bright stars and, because it lies in rich Milky Way star fields it contains many deep sky objects, including open clusters and nebulae.
